

1 IN THE UNITED STATES DISTRICT COURT
2 FOR THE DISTRICT OF SOUTH CAROLINA
3 CHARLESTON DIVISION
4 CASE: 2:98-1879-23

5 SUZANNE Q. LITTLE, INDIVIDUALLY
6 and as Personal Representative
7 of the Estate of SAMUEL MARTIN
8 LITTLE, Deceased,

9 Plaintiff,

10 - vs -

COPY

11 BROWN & WILLIAMS TOBACCO
12 CORPORATION, individually
13 and as successor by merger to
14 THE AMERICAN TOBACCO COMPANY
15 AND R.J. REYNOLDS TOBACCO COMPANY,

16 Defendants.

17 DEPOSITION OF: CAROLYN E. REED, M.D., Volume III

18 DATE: Wednesday, May 10, 2000

19 TIME: 8:10 a.m.

20 LOCATION: MUSC, Room 409
21 171 Ashley Avenue,
22 Charleston South Carolina

23 TAKEN BY: Attorneys for the Defendants

24 REPORTED BY: ROCHEL ALBERT
25 CERTIFIED SHORTHAND REPORTER

17 BY: ROBIN A. SCHMAHL

18 and STEPHANIE PARKER

19 Attorneys at Law

20 3500 One Peachtree Center

21 303 Peachtree Street, NE

22 Atlanta, Georgia 30308-3242

1 It was stipulated by and between counsel
2 for the parties that this deposition is taken
3 pursuant to notice and that all questions as to
4 notice are waived; that all objections, save as to
5 the form of the question, are reserved until the
6 time of trial; that the deposition is taken
7 pursuant to the South Carolina Rules of Civil
8 Procedure, for the purposes allowed therein; and
9 that the deponent was explained her right to read
10 and sign the deposition and reserved that right.

11 =====

12 CAROLYN E. REED, M.D.,

13 =====

14 called as a witness and having been first duly
15 sworn, testified as follows:

16 D-I-R-E-C-T E-X-A-M-I-N-A-T-I-O-N

17 BY MS. SCHMAHL:

18 Q. Good morning, Dr. Reed. My name is Robin
19 Schmahl. We actually met during the first two days
20 of your deposition.

21 A. Yes.

22 Q. Do you understand that you are still
23 under oath?

24 A. Yes.

25 Q. The same rules apply as to the first two
 days of your deposition.

1 A. Yes.

2 Q. Let me hand you what will be marked as
3 Defendants' Exhibit Number 35.

4 (Defendants' Exhibit 35 was marked by the
5 court reporter and is attached to the end of the
6 deposition.)

7 Q. This is a letter that we received from
8 plaintiff's counsel, Ness Motley, on March 21st,
9 listing four books that you intended to rely on and
10 noted references to those book chapters, correct?

11 A. Yes. I am not quite sure what you mean
12 by "rely on" in the sense, what you asked me before
13 was some chapters on smoking, carcinogenesis, and
14 these were just some of the articles that exist,
15 and I picked them out and gave them to, you are
16 right, Ness Motley.

17 Q. Dr. Reed, did you understand that
18 actually what we asked for is any materials that
19 you yourself were relying on as the basis for any
20 of your opinions in this case?

21 A. What I understood was that when I made
22 this statement that smoking is related to lung
23 carcinogenesis you wanted some background materials
24 that I relied on. So I picked out some of the
25 articles that existed in the literature regarding

1 this. These are book chapters. There are several
2 references. What I tried to do is pick out the
3 references that the book chapters had also used, so
4 that you would have a complete set of articles.
5 They are by no means the only articles that exist.

6 Q. Okay. Let me for the sake of clarity ask
7 you, are you yourself relying on these four
8 chapters as the basis for your opinions in this
9 case?

10 A. No, not just these articles. You asked
11 me for series of articles to back up some of what I
12 was saying. That is my understanding. If I
13 misunderstood, I am sorry. You asked me for a
14 series of articles that would help back up my
15 statement, because when you asked me, I didn't have
16 any references with me. My understanding is that
17 you wanted references.

18 These are a series of references that
19 happened to be the easiest ones that I could put my
20 hands on. If you wanted me to give you more
21 references to help, I would have to go back and
22 research all of this. This will take hours of my
23 time.

24 Q. Dr. Reed, let me just ask you to answer
25 my question. Are you relying on --

1 A. I am relying on some of these articles.
2 They are not the only articles that I am relying
3 on.

4 Q. I am not asking if this is the total
5 universe of the materials that you have looked at.

6 A. Right.

7 Q. But are you relying on these four
8 chapters?

9 A. Yes.

10 Q. Okay. My understanding from your last
11 deposition is that the referenced footnotes in
12 these articles, that you had not read them and that
13 you were not --

14 A. That's correct.

15 Q. -- relying on them, and did not intend to
16 testify about the substance of those articles?

17 A. Let me make myself real clear so we get
18 this clarified. The book chapters that you have
19 are basically a summary of the references that are
20 listed.

21 Q. Okay.

22 A. So in order to be correct, to rely on
23 these book chapters, you would have to go get all
24 of these references. You would probably throw out
25 some of the references because they probably will

1 not be germane, because all I could do is read the
2 titles.

3 I am not going to testify that I am an
4 expert on lung carcinogenesis, or as you asked me
5 last time, epidemiologist. You asked me for
6 background material for the statement that I made
7 that lung cancer and smoking are connected.

8 Yes, I am relying on these book chapters
9 to help support that statement, but you are
10 absolutely correct that you would have to go back
11 and get some of these references like you see on
12 number 2, "lung cancer principles and practices."
13 I listed references 1 through 40. It could be that
14 2 and 3 and 17 really aren't germane. I don't
15 know. I would have to have somebody go get all of
16 those references, which I would be happy to look
17 at, but somebody is going to have to go get those
18 references.

19 Q. This is what we are very much expecting
20 to be the last day of your deposition.

21 A. Right.

22 Q. Let me just break this down. You have
23 not read the references in Chapter 18 of the lung
24 cancer principles and practice book; is that
25 correct? You are not prepared?

1 A. Right. That is exactly correct. My
2 understanding was that you -- when I gave you those
3 three chapters was that if you wanted the
4 references, somebody in your department or your
5 office was going to get all of those references.
6 You know, I never was instructed to go get all of
7 those references. If you want me to, we can do
8 that.

9 Q. I am in no way criticizing or saying that
10 you should have.

11 A. I am simply stating that if that is what
12 you want us to do, we are going to have to send
13 somebody to the library to do all of that. It's
14 not going to -- it's going to be a relatively long
15 task. If that is what you want, then you need to
16 clarify that today because that is going to take a
17 tremendous amount of time.

18 Q. To the extent that we were going to talk
19 about it before trial, it was to talk about it
20 today. Would I be correct then in that sitting
21 here today you are not prepared to talk about any
22 of the specifics of the footnotes?

23 A. That's correct.

24 Q. Then in that case, I won't ask you any
25 questions about the footnotes.

1 A. Okay.

2 Q. And to the extent you decide to start
3 looking at them between now and trial, we will
4 object to testimony on those, because we did not
5 have the opportunity to ask you about it either
6 today or at your earlier deposition.

7 A. That is up to you.

8 Q. Dr. Reed, since the date of your last
9 deposition, have you discussed this case with
10 anyone from Ness Motley?

11 A. I only called, I think it was this week.
12 I called this week to simply ask whether we thought
13 this was going to be the last day. I didn't
14 discuss the case. I discussed the timing.

15 Q. Okay. Have you discussed anything with
16 Dr. Turrisi?

17 A. No.

18 Q. Dr. Rocha Lima?

19 A. No.

20 Q. Dr. Green?

21 A. No.

22 Q. Dr. Hardly?

23 A. No.

24 Q. Anyone else?

25 A. No.

1 Q. Since March 22nd, have you reviewed any
2 other materials with regard to this litigation in
3 Martin Little's case?

4 A. No.

5 Q. During your last deposition after you had
6 left we had introduced into evidence the four book
7 chapters that are referenced in Defendants'
8 exhibit.

9 A. Yes.

10 Q. Have you had a chance to review and read
11 Chapter 18 of the lung cancer principles book?

12 A. No.

13 Q. When was the last time that you had
14 reviewed that chapter?

15 A. Months ago.

16 Q. Are you prepared to discuss the
17 conclusions reached in that chapter?

18 A. Not without rereading it.

19 Q. Sitting here today, do you know what
20 conclusions or points contained in Chapter 18,
21 which was Exhibit 30, you relied upon in reaching
22 your opinion?

23 A. No. I would have to reread the chapter.
24 It has been several months.

25 Q. Would it be fair to say that you

1 couldn't, sitting here today, say what conclusions
2 or points you agreed with and what conclusions or
3 points you disagree with?

4 A. Correct.

5 Q. On Exhibit 31, which is the epidemiology
6 chapter from the Thoracic Surgery Book by Pierson,
7 have you reviewed that chapter?

8 A. No.

9 Q. Are you prepared to discuss it today?

10 A. No.

11 Q. Do you know, would it be fair then that
12 you don't know what conclusions you are relying
13 upon?

14 A. Correct.

15 Q. You don't know what conclusions you are
16 disagreeing with?

17 A. Correct. I would have to reread all of
18 these three chapters again.

19 Q. Again, Chapter 19, Lung Cancer Principles
20 and Practice?

21 A. Same thing.

22 Q. You haven't read it?

23 A. I have read it, but not recently.

24 Q. You have read it but not recently?

25 A. Right.

1 Q. Okay. You don't know what conclusions
2 you relied upon?

3 A. Correct.

4 Q. And you don't know what you disagree on?

5 A. Correct.

6 Q. And the last one, Chapter 85?

7 A. Same thing.

8 Q. Haven't read it recently?

9 A. No.

10 Q. Don't know what you --

11 A. No.

12 Q. Doctor, let me hand you what will be
13 marked as Defendants' Exhibit 36.

14 (Defendants' Exhibit 36 was marked by the
15 court reporter and is attached to the end of the
16 deposition.)

17 Q. Exhibit 36 is an article coauthored by
18 you in 1994 entitled, "Prevalence of p53 Mutations
19 in Patients with Squamous Cell Carcinoma of the
20 Esophagus;" is that correct?

21 A. Correct.

22 Q. And it was published in the Journal of
23 Thoracic and Cardio --

24 A. Cardiovascular Surgery.

25 Q. Does that appear to be a journal?

1 A. Yes, it is.

2 Q. Did you personally review the study cited
3 in the article?

4 A. Yes. This was written by Christopher
5 Gates, who is a resident in our program. He
6 studied in the laboratory of Dr. Jonathan Bromberg.
7 My part in this case was to supply some of the
8 materials, the specimens that he studied. But the
9 actual basic science was done by Dr. Gates.

10 Q. But would it be fair to assume that if
11 your name is on this article you did review the end
12 product, you did review the references?

13 A. Yes. Everybody that is listed as an
14 author reviewed the article before it went out.

15 Q. Sitting here today, do you still stand by
16 your article?

17 A. Yes.

18 Q. And having read the references, you are
19 aware of medical literature that suggests that p53
20 mutations in lung tumors are associated with
21 smoking, correct?

22 A. Correct.

23 Q. Directing your attention to the first
24 paragraph of page 148. Your article concludes that
25 coastal South Carolina has one of the highest rates

1 of squamous cell esophageal cancer in the world; is
2 that correct?

3 A. That's correct.

4 Q. More than four times the global average?

5 A. Correct.

6 Q. Are you aware of any medical literature
7 discussing the higher incidence of lung cancer in
8 coastal South Carolina?

9 A. No.

10 Q. Going on to the next paragraph on page
11 148 of Exhibit 36, your article acknowledges that
12 the following substances have been most frequently
13 implicated in the development of esophageal cancer;
14 tobacco, correct?

15 A. Yes.

16 Q. Alcohol?

17 A. Yes.

18 Q. Opiates?

19 A. Yes.

20 Q. Aflatoxins?

21 A. Yes.

22 Q. Caustic agents?

23 A. Right. These are world environmental
24 exposures. What I mean by that is that, for
25 example, caustic agents is probably worldwide.

1 Aflatoxin is probably more limited to certain parts
2 of the world. There's an esophageal cancer belt
3 across the world, and there are probably different
4 agents in different parts of the belt that have
5 something to do with esophageal cancer. Tobacco
6 and alcohol are well-known risk factors for
7 squamous cell cancer of the esophagus.

8 Let me just say that since this article
9 has been published, we do not have as high a rate
10 of esophageal cancer in South Carolina. We, like
11 everybody else in the state, is seeing a rise in
12 adenocarcinoma, and that has now superseded in our
13 tumor registries squamous cell carcinoma, just for
14 the record.

15 Q. I am curious which opiates have been
16 implicated in the development of esophageal cancer.

17 A. These are probably related to opiates --
18 squamous cell carcinoma of the esophagus is very
19 well-known in the belt across northern China where
20 they smoke all kinds of weird substances with some
21 opiates. Like, for example, tea leaves and things
22 like this have some substances in them that have
23 been purported to be associated with cancer.

24 And it goes back in China to the fact
25 that the areas that have a large number of squamous

1 cell carcinoma, they have a number of practices
2 that are relatively strange, and they drink hot tea
3 and they smoke what is called beetle nuts and
4 things like that. And some of those substances are
5 probably involved with lung cancer.

6 I don't know of any direct work that has
7 looked at, for example, taking mice and giving them
8 these substances and have them develop cancer.
9 Most of this listed right here, this sentence that
10 you just stated, is related to epidemiologic
11 studies, putting together unusual substances with
12 the fact that there is this incredible hot spot
13 across -- around the Caspian, across China. In the
14 United States. It's Washington, D.C. and the
15 coastal Lowcountry of South Carolina. That is for
16 squamous cell.

17 Q. But your understanding is that, at least
18 for squamous cell cancer, that those are inhaled
19 opiates, beetle nuts, opium, things of that nature?

20 A. I would guess so, yes. I am just talking
21 about -- this opiate is directly related I think to
22 the belt in China, not the United States.

23 Q. Would you consider marijuana to be an
24 opiate?

25 A. Uh-huh, yes.

1 Q. Would you consider cocaine to be an
2 opiate?

3 A. Yes.

4 Q. Continuing at the top of the second
5 column on page 148, your article suggests that
6 there may also be an underlying genetic
7 predisposition for esophageal cancer in some cases;
8 is that correct?

9 A. Yes, very unusual genetic syndrome.
10 Tylosis is extremely unusual and so is Li-Fraumeni
11 syndrome.

12 Q. If you turn, please, to page 149 under
13 the results section.

14 A. Yes.

15 Q. Your team had conducted p53 testing on 15
16 different squamous cell samples, correct?

17 A. Right.

18 Q. According to your article, 10 of the
19 specimens exhibited at least one p53 mutation?

20 A. Correct.

21 Q. Then two-thirds of the squamous cell
22 cancers that your team examined showed genetic
23 mutations?

24 A. Showed point mutations, yes, that are in
25 the genes, which can be either -- that doesn't mean

1 it necessarily is inherited. That means that
2 there's been a mutation. There could have been an
3 environmental cause. It could have been in the
4 genes. Who knows.

5 But, yes, you are correct that about --
6 and that actually goes along with the literature,
7 about 50 to 60 percent of squamous cell cancer of
8 the esophagus has -- this was done with Polymerase
9 chain reaction. So this is quite specific.

10 Q. But this was specifically testing for
11 p53?

12 A. P53, yes.

13 Q. Turning your attention to the second full
14 paragraph in the second column, the second full
15 paragraph in the right column on page 150. Your
16 article states that a great deal of interest has
17 been generated in whether, quote, specific
18 mutations can implicate the etiology of a tumor,
19 correct?

20 A. Where are you reading?

21 Q. Sorry. Page 150.

22 A. 150. I'm sorry.

23 Q. Right-hand column.

24 A. Got you.

25 Q. Second full paragraph.

1 A. Right.

2 Q. Would you like for the court reporter to
3 reread the question?

4 A. Do you mind if I just reread this for a
5 moment?

6 Q. No.

7 (The record was read by the reporter.)

8 Q. And you go on to note that all 15 of the
9 patients from whom the squamous samples were taken
10 had a significant history of tobacco use?

11 A. Correct.

12 Q. What do you consider a significant
13 history?

14 A. Probably greater than 30 or 40 packs a
15 year history.

16 Q. And then later on in that paragraph you
17 go on to cite a study by Field, which is this study
18 footnoted at reference eight, which found
19 78 percent of smokers that they tested had p53
20 mutations compared to 14 percent of nonsmokers,
21 correct?

22 A. That is what it states, yes.

23 Q. So your team found 67 percent, roughly
24 two-thirds, with squamous cells had p53 mutations,
25 and the study cited here had about 78 percent,

1 correct?

2 A. Correct.

3 Q. Is that consistent with the medical
4 literature on the prevalence of p53 mutations?

5 A. In squamous cell cancer, yes, of the
6 esophagus.

7 Q. Just backing up a bit to the discussion
8 section on page 149. It's in the right-hand
9 column. Your article states that squamous cell
10 carcinoma -- sorry, let me be more specific -- that
11 squamous cell esophageal cancer is, quote, of
12 particular interest because epidemiological data
13 suggests many environmental exposures that may be
14 associated with an increased risk of its formation,
15 correct?

16 A. Correct.

17 Q. Have we already discussed this sort of
18 environmental and genetic?

19 A. Right. That goes along with the fact
20 that epidemiologically the hot spots are clustered.
21 So what happened is these people went to these hot
22 spots and looked at various social and
23 environmental factors that might be connected to
24 squamous cell carcinoma.

25 Again, it goes back to the hot tea and

1 the beverages, and this squamous cell carcinoma is
2 extremely rampant, if you will, in South Africa and
3 parts of Africa where it may be related to lack of
4 minerals, certain grains, et cetera.

5 The problem with this whole thing is that
6 what was hoped was that because there are certain
7 cluster hot spots over the world, that when
8 epidemiologists visited these hot spots there would
9 be one agent that was sort of common among this
10 group. Unfortunately that is not what they found.
11 They found what is stated here, that there may be a
12 variety of environmental factors that are connected
13 with squamous cell carcinoma of the esophagus.

14 Q. And those are what we have already
15 discussed, the opiates, the tobacco, the hot tea,
16 beetle nuts?

17 A. All that sort of thing. Lack of
18 minerals, it could be selenium and zinc. It's
19 actually a pretty long list. I would have to go
20 back to look to make sure. The items that we have
21 stated have all been stated before as possible
22 environmental factors that may increase a person's
23 risk for squamous cell carcinoma of the esophagus.

24 Q. And that would be social behaviors like
25 the tea drinking, correct, as being one --

1 A. For example, yes. In China they drink a
2 lot of hot tea, so one of the questions is are they
3 using a substance in their hot tea that is very
4 different from the English tea, et cetera, things
5 like that. If you are in a country that is very
6 poor and the soil is lacking X, Y, Z minerals, is
7 there any possibility that could have anything to
8 do with it?

9 The problem with all of this that we are
10 talking about is whether there's a true cause and
11 effect rather than a simple linkage of here's an
12 item and here's something, are they linked. It's
13 very difficult to prove.

14 Q. Right.

15 A. I will give you another example. It's
16 been stated that perhaps moonshine in South
17 Carolina has something to do with squamous cell
18 carcinoma of the esophagus because of the high
19 incidence of squamous cell carcinoma in the
20 Lowcountry occurs among black males, particularly
21 alcoholics. And many of these black male
22 alcoholics fix their own alcohol. And so there's
23 been a suggestion.

24 But if you go back and read some of this
25 literature it's a very loose connection. It's not

1 that we gave a rat moonshine and they developed
2 squamous cell carcinoma.

3 Q. Right.

4 A. So it's -- a lot of epidemiological study
5 is very soft in that regard. That is all that I
6 mean. It's very hard to say. You really can't
7 make the statement that this causes the cancer.
8 All you can look at is associations.

9 Q. Right.

10 A. And these that you have listed and we
11 have talked about so far are associations.

12 Q. Because in all of these cases, as you
13 said, you can't make a rat drink some hot tea and
14 see if it has squamous cell cancer?

15 A. Right.

16 Q. Or have it smoke a little beetle nut to
17 see what happens?

18 A. The problem with all of this is what is
19 probably going on is a lot -- it's a
20 multifactorial -- carcinogenesis is a
21 multifactorial process. So you have -- you might
22 have an underlying genetic instability, you might
23 have an underlying genetic process that needs to be
24 triggered and that trigger could be a variety of
25 environmental projects. And we are finding that

1 more and more now. There's just thousands of
2 mutations that are involved in the development of
3 cancer probably.

4 Q. And diet may have an effect on it?

5 A. Diet may. It may have an effect. For
6 example, if you are predisposed to colon polyps,
7 can you make it better by eating a diet with more
8 fiber? Well, you know, an article just came out
9 that disputes that, even though that has been the
10 association and why everybody has been doing it.
11 That is what I mean by some of the weak links in
12 epidemiologic studies.

13 Q. And then heredity may have some factor in
14 the development of cancer?

15 A. Everybody in this room has oncogenes that
16 are existing in their body right now that can be
17 turned on or off. The question is, what turns them
18 on and what turns them off? You have the genes for
19 cancer right now in your body, but you have either
20 repressor genes or growth factors that have been
21 turned on or off, depending on whether they are
22 repressors or growth factors.

23 So we all have the genes for cancer. We
24 know that now. The question is, what are the
25 trigger factors that turn some of these genes on

1 and off? And if they are turned on, what is their
2 mechanism so we can plot that mechanism?

3 Q. And with respect to the things that turn
4 them on, that would turn on the oncogenes, that is
5 part of that whole multifactorial environmental
6 exposure, heredity?

7 A. There are probably a variety of -- there
8 most certainly are a variety of agents that can do
9 that.

10 Q. And that would be true for lung cancer as
11 well as esophageal cancer; is that correct?

12 A. Yes. We believe that all cancers are
13 like that. The problem is there are going to be
14 certain triggers that are more associated with some
15 cancers than others. For example, p53 mutation is
16 very widespread in solid tumors. So it probably is
17 one of the early mutations that can occur in a
18 number of cancers. But when and where and what it
19 gets triggered, it is probably one of the least
20 specific mutations because it's so widespread.

21 It would be nice if, gee, squamous cell
22 carcinoma is the only cancer that p53 was a
23 mutation in, because then it would give more
24 impetus to do something with p53. It so happens
25 that p53, because it's a general tumor suppressor

1 gene, is involved in a lot of different cancers.

2 Q. Okay. In your opinion, is there a high
3 prevalence of p53 mutation of the squamous cells
4 irrespective of where the tumor is located?

5 A. I would have to really look at that. I
6 don't have it on my fingertips the various list of
7 cancers and what articles.

8 Another problem with this whole research
9 is that the reason we got a high number in this
10 article of p53 mutations is if you notice that we
11 looked at point mutations with Polymerase chain
12 reaction. Most p53 mutations are now being looked
13 at with immunochemistry, i.e. antibodies. Some of
14 those antibodies only react with -- if you read the
15 article you will see that there are actually
16 several different mutations.

17 Q. Yes.

18 A. So it could be an exon 9 or an exon
19 whatever. Some of those monoclonal antibodies only
20 bind with one mutation rather than some of the
21 others. So the reports are all over the map. If
22 you want to read about p53 mutation, you can pick
23 up a book that says p53 mutation, for example, in
24 lung cancer ranges from 30 to 60 percent. That is
25 quite a range, and probably has to do with the

1 methods of detecting p53 mutation. If you want my
2 opinion, p53 mutation is quite widespread, but I am
3 not prepared to give you for each cancer an exact.

4 Q. So there's more than one way to check for
5 p53 mutations. Is it the immunohistochemical
6 stain?

7 A. There's immunochemical stains using
8 monoclonal antibodies against various things. The
9 Polymerase chain reaction that is stated is very
10 time-consuming. And when you are looking at the
11 gene sequencing and looking at all the point
12 mutations, you are going to pick up more mutations
13 than you are with monoclonal antibodies.

14 Q. In your opinion then, this chain reaction
15 is a more sensitive test than doing --

16 A. Yes.

17 Q. You recognize genetic testing for
18 p53 besides the immunochemical testing, correct?

19 A. Say that again.

20 Q. Do you acknowledge the validity of p53
21 testing besides simply immunochemical staining?

22 A. I am just telling you there's a variety
23 of methods to look for p53 mutations, which I am
24 certainly not an expert in. Let me just say that
25 up front. What you will see in the methods section

1 is that these tumor biopsy specimens were either
2 grown in tissue culture or they were
3 cryoprecipitated to get the raw RNA and DNA of the
4 specimens.

5 Most people that are dealing with p53
6 mutations today are taking -- for example, the
7 tumor specimen that comes out of the body, they are
8 taking the slide that they looked at under the
9 microscope and they are simply running a, if you
10 will, an antibody test or immunochemical test, if
11 you will, on that slide. That is very different
12 from taking the tumor tissue itself and looking at
13 the RNA from the tumor tissue.

14 And what I am saying here is that I
15 believe you taking the RNA or DNA and taking it
16 directly from the tumor is going to be much more --
17 probably more precise than simply running an
18 antibody stain. So there's just a variety of ways
19 to look at it. And that is the reason when you
20 read the literature it says 30 to 60 percent of
21 these tumors may have p53 mutations. It's not very
22 precise. The reason it's not very precise is that
23 not everybody is using the same test.

24 Q. Okay. In your opinion are p53 mutations
25 caused by tobacco smoke? Is that the conclusion

1 that you have drawn?

2 A. My conclusion or my -- it's probably
3 better to say supposition -- is that tobacco smoke
4 is probably one of those factors that can result in
5 a point mutation that results in a mutant p53.

6 Q. Let me ask it this way. If a cancer
7 patient was positive for p53 mutation, and you knew
8 that that patient was a smoker, could you opine
9 with a reasonable degree of medical certainty that
10 the mutation was caused by tobacco smoke?

11 A. Not necessarily. There can be all kinds
12 of reasons. We just said there's a number of
13 environmental causes for -- you cannot -- you can't
14 connect the two because somebody smokes and they
15 have a cancer and they have a p53 mutation. I
16 don't think that you can say he is a smoker,
17 therefore, his p53 mutation came from smoking.

18 Q. Okay.

19 MS. SCHMAHL: Actually, would you mind if
20 we take a break?

21 (A break was taken.)

22 BY MS. SCHMAHL:

23 Q. Jerry, I just wanted to put on the record
24 a significant portion of the remainder of our
25 portion has to do with those specific discussions

1 of the four book chapters that were references,
2 reliance materials in Defendants' Exhibit 35.

3 My understanding from the testimony is
4 that Dr. Reed has not read them recently, is not
5 prepared to discuss them in detail, is not certain
6 what she agrees with or what she disagrees with.

7 Do you have any different understanding
8 of her testimony?

9 MR. EVANS: I am not going to discuss
10 that on the record. You are welcome to repeat your
11 questions. I think you have covered that with
12 Dr. Reed, and I think that testimony is clear.

13 MS. SCHMAHL: Well, because my
14 understanding is that this is not an area that
15 Dr. Reed is prepared to go into today, I am not
16 going to ask my series of questions on the four
17 book chapters referenced in Defendants' Exhibit 35,
18 and just for the record, we will object if it comes
19 up at trial to testimony on this subject, because
20 we were not given the opportunity to do a full
21 examination today or during the earlier deposition
22 on these four book chapters.

23 A. You didn't ask me to read them. I will
24 be happy to do that. And if you want to come back
25 and have me do that, I will be happy to do that,

1 but nobody asked me to do that.

2 Q. Right. That is just a lawyer thing.

3 (Defendants' Exhibit 37 was marked by the
4 court reporter and is attached to the end of the
5 deposition.)

6 Q. Dr. Reed, I am going to hand you what
7 will be marked as Defendants' Exhibit 37. This is
8 an article entitled "Bronchioloalveolar Carcinoma"
9 by John Barkley and Mark Green, correct?

10 A. Yes.

11 Q. And it was published in the --

12 A. Journal of Clinical Oncology, 1996.

13 Q. And is that a peer review journal?

14 A. Yes, I believe so. It's a medical
15 journal.

16 Q. Dr. Mark Green, the coauthor of that, he
17 is the head of the Hollings Cancer Center here at
18 MUSC; is that correct?

19 A. Correct.

20 Q. I just want to go through this article
21 with you a little bit. First, let me ask you about
22 some statements that appear in the summary which is
23 at the top of the left-hand column on page 2377.
24 Is that called the abstract, that bolded portion on
25 the top --

1 A. Right.

2 Q. -- of 2377? Starting with the second
3 sentence in the summary under "results," it says,
4 quote, patients with BAC tend to be younger at
5 diagnosis. Would you agree with that statement?

6 A. I would have to do the research because I
7 agree with the second, they are more likely to be
8 females. My experience is they are all over the
9 map. I will accept what he said if he has reviewed
10 the article. I would have to go back and look at
11 references. That is not a common thing to my
12 knowledge, but the second is. They are more likely
13 to be female.

14 Q. How about the third, less likely to be
15 cigarette smokers?

16 A. Correct.

17 Q. If you would look, please, at the table
18 that is on page 2379 of Exhibit 37.

19 A. 2379?

20 Q. Yes, ma'am.

21 A. Okay.

22 Q. There is a little table at the top of the
23 left-hand column, "Table I. Diagnostic Criteria for
24 BAC." Would you agree that no evidence of extra
25 thoracic adenocarcinoma is one of the diagnostic

1 criteria for BAC?

2 A. Yes.

3 Q. Would you agree that absence of a central
4 bronchogenic source is a diagnostic criteria?

5 A. Yes.

6 Q. Would you agree that peripheral
7 parenchymal location is a diagnostic criteria?

8 A. Yes.

9 Q. Would you agree that no distortion of the
10 pulmonary interstitium is a diagnostic criteria?

11 A. Yes.

12 Q. Would you agree that neoplastic cells
13 growing along alveolar septae is a diagnostic
14 criteria?

15 A. Yes.

16 Q. Would you add anything for the diagnostic
17 criteria for BAC?

18 A. Not right off the top of my head.

19 Q. If you think of anything during the
20 course of the deposition, would you let me know?

21 A. Sure.

22 Q. Also on page 2379 of Exhibit 37, the last
23 full paragraph in the left-hand column, Dr. Green
24 has a discussion about the literature showing an
25 apparently inconsistent finding of an increased

1 odds ratio for the development of BAC following
2 quitting smoking.

3 A. Tell me where you are.

4 Q. It is the last full paragraph in the
5 left-hand column on page 2379.

6 A. I got you. I found it. I am reading it.

7 Q. Just tell me whenever you are done.

8 A. Yes. Go ahead.

9 Q. Would you agree that there are some
10 increased odds ratio for developing BAC after
11 quitting smoking?

12 A. I have no idea.

13 Q. It goes on in the last sentence of the
14 last full paragraph in the left-hand column, it
15 says that more work to evaluate cigarette smoking
16 as a possible etiologic agent in BAC needs to be
17 performed. Would you agree with that statement?

18 A. Yes.

19 Q. And the next statement, the next sentence
20 which is the beginning of the following paragraph
21 notes that a vital etiology for BAC has also been
22 postulated. Would you agree with that statement?

23 A. I don't know anything about that.

24 Q. I am referring to the first full
25 paragraph on 2379. It's actually two paragraphs

1 up. Dr. Green notes that BAC may arise in lung
2 parenchyma damaged by prior tuberculosis, pulmonary
3 infection or abscesses and/or abscesses and
4 pulmonary fibrosis of any cause. Would you agree
5 with that statement?

6 A. Yes.

7 Q. Moving on to page 2380. Sorry. If you
8 could go back to 2379. It would be the second full
9 paragraph in the left-hand column of 2379.

10 The impact of cigarette smoking on
11 induction of BAC is somewhat controversial. Would
12 you agree with that statement?

13 A. Yes.

14 Q. On page 2380 of Exhibit 37, Dr. Green
15 discusses molecular biology. He has got a section
16 there. Do you see that?

17 A. Uh-huh.

18 Q. Under that molecular biology section
19 there's a statement that the role of oncogenes and
20 tumor-suppressor genes in lung cancers are
21 receiving much attention. Would you agree with
22 that statement?

23 A. True of all cancers today, correct.

24 Q. They go on to say that the prevalence of
25 activated or overexpressed oncogenes or of mutated

1 Q. The next sentence after that states,
2 "Prior pulmonary parenchymal damage, various
3 occupational exposures, tobacco smoking and
4 retroviral infections have all been implicated."

5 A. They have all been suggested as possible
6 etiologic agents.

7 Q. Would you agree with that as far as it
8 relates to BAC? Do you have any reason to disagree
9 with that?

10 A. No reason to disagree with the statement.

11 Q. If I can get you, please, just to turn
12 back to page 2379 of Exhibit 37. There's a section
13 in the right-hand column of that that is entitled
14 "Histopathology." That first sentence under the
15 title "Histopathology" states that, "The
16 histological classification of NSCLC can be
17 difficult." Would you agree with that statement?

18 A. Not particularly, no. I am not sure. I
19 think you are reading this out of -- I think what
20 the statement means -- if you read the whole
21 statement it says the histological classification
22 of non-small cell lung cancer can be difficult with
23 the subclassification of adenocarcinoma into acinar
24 papillary mucus secreting and bronchioloalveolar
25 even more difficult.

1 I don't even know what that first
2 sentence means because most of the final pathology
3 in non-small cell lung cancer is adequately
4 classified, whether it's adenocarcinoma, large cell
5 or squamous cell. And if it's not, then they do
6 special staining to make it more adequate.

7 I am not sure I necessarily agree with
8 that statement. There is nothing stating here, for
9 example, in "X" number of cases or whatever. That
10 is a pretty general statement. I am a little
11 surprised that it's been made.

12 Q. So you do not agree that --

13 A. The histological classification of
14 non-small cell is difficult?

15 Q. Right.

16 A. It can be difficult, but is it usually
17 difficult? No. I don't know how you are
18 interpreting -- I don't want me to read what you
19 are saying. You have got histological
20 classification can be difficult. In some case it
21 can be difficult. But in general is it difficult?
22 No.

23 Q. Would you agree that there is a degree of
24 variability in classifying of non-small cell lung
25 cancers?

1 A. Sure.

2 Q. Would you agree that it was the case in
3 this case, one pathologist looks at the slide and
4 says that it's squamous, another pathologist looks
5 at the slide and says that it's large cell lung
6 cancer?

7 A. Large cell lung cancer is a wastebasket
8 term. Most large cell lung cancers are either very
9 undifferentiated squamous cells or special staining
10 adenocarcinomas.

11 Q. Okay.

12 A. So those of us that use the term "large
13 cell carcinoma" understand that when you get to
14 large cell carcinoma, it's a very malignant cancer
15 and it's usually undifferentiated. So it's very
16 hard by special studies sometimes to clarify
17 whether it was the squamous line or the
18 adenocarcinoma line.

19 Most of us feel that large cell carcinoma
20 is probably more likely a subvariant of
21 adenocarcinoma rather than the squamous, but it can
22 work either way. That is why we have large cell
23 carcinoma. Frequently you get a whole battery of
24 special stains to see which side it's on, whether
25 it goes towards squamous or towards adenocarcinoma.

1 The important point is that large cell is not a
2 small cell. It's a non-small cell lung cancer.

3 Q. And that for purposes of treatment is
4 really what's important?

5 A. That's correct. The most important thing
6 for treatment is are you dealing with a small cell
7 or a non-small cell.

8 Q. Would you agree that the more experienced
9 that the pathologist is, their ability to identify
10 BAC would improve?

11 A. I would definitely agree that a
12 pathologist that is a lung cancer specialist
13 pathologist will be better at diagnosing BAC than
14 not.

15 Again, BAC comes in a variety of forms.
16 And when it's in the form that it's growing along
17 this septum, like you have your criteria up here,
18 neoplastic cells growing along alveolar spaces,
19 that is very classic of bronchioloalveolar
20 carcinoma.

21 So of all the diagnostic criteria that
22 you asked me to look at, that is the most
23 diagnostic. In its best form bronchioloalveolar
24 carcinoma has a very classic look to it on light
25 microscopy.

1 Q. We have discussed from your article a
2 number of factors that are at least statistically
3 associated with lung cancer, tobacco, correct?
4 Alcohol, yes?

5 A. With lung cancer?

6 Q. No.

7 A. With esophageal cancer?

8 Q. That is associated with esophageal
9 cancer?

10 A. Squamous cell carcinoma. You have to be
11 careful there because there are two major types of
12 cancer in the esophagus. Of squamous cell
13 carcinoma of the esophagus, tobacco, alcohol,
14 previous head and neck tylosis, caustic agents, et
15 cetera.

16 Q. In your opinion then would alcohol not be
17 a risk factor for lung cancer?

18 A. To my knowledge, it is not a factor.

19 Q. Could you cite me to any medical
20 literature or anything that would --

21 A. If you go back, for example, and look at
22 those chapters, alcohol, to my knowledge -- again,
23 I would have to review them again -- is not right
24 up there as one of the causal factors.

25 Q. Are you aware of any medical

1 literature -- have you done a study of the medical
2 literature to determine one way or another whether
3 alcohol is a risk factor for lung cancer?

4 A. I would have to go back and look at the
5 literature. It's not common. It's not on the tip
6 of your tongue when you are talking about is it
7 related like squamous cell carcinoma of the
8 esophagus. If you had said adenocarcinoma of the
9 esophagus I wouldn't have named alcohol. If you
10 say lung cancer to me, I wouldn't have named
11 alcohol.

12 Q. Okay. We had already discussed during
13 your previous depositions marijuana. Since the
14 time of your previous deposition, have you done any
15 Med-line searches or any further research on any
16 association?

17 A. No.

18 Q. Are you aware of medical literature that
19 discusses caustic agents as a risk factor for lung
20 cancer?

21 A. What is your definition of caustic agent?

22 Q. Well --

23 A. Caustic agents are usually drunk. So you
24 are talking about caustic agents drinking lye,
25 acid, therefore, that is why you talk about caustic

1 agents in the G.I. tract. It's hard to get caustic
2 agents into your lungs.

3 So it depends on what your definition is.
4 To me when you say caustic agent what we are
5 talking about in medical literature is like lye
6 or -- let me go back to say the best way to explain
7 that is it's listed as, for example, a causative
8 agent of esophageal cancer. That comes from small
9 kids that got in and drank lye or acid or something
10 like that. It's usually lye. And then 40 years
11 later developed cancer of the esophagus.

12 We know that those kids that drink that
13 or have caustic lye ingestion are at an increased
14 risk in the future to have squamous cell carcinoma.
15 So that would not be a cause of lung cancer because
16 when you drink you don't get lye into your lungs.

17 Q. Are caustic agents a risk factor for
18 esophageal cancer because it causes scarring?

19 A. Yes. It's probably related to the
20 scarring, and they get squamous cell cancer, not
21 adenocarcinoma.

22 Q. In your opinion, is indoor Radon exposure
23 a risk factor for lung cancer?

24 A. It has been purported to be. I am not an
25 expert in epidemiology or Radon exposure. It is

1 uniformly listed when you get an article about the
2 epidemiology of lung cancer as one of those factors
3 that has been associated with a higher risk.

4 Q. Is it correct that another risk factor
5 that is uniformly listed is occupational exposures?

6 A. Secondhand smoking, asbestos.

7 Q. Nickel?

8 A. Coal miners, nickel, yes.

9 Q. Vinyl chloride?

10 A. Vinyl chloride.

11 Q. Are you aware of the medical literature
12 that discusses a high animal fat diet as being a
13 risk factor for lung cancer?

14 A. No. No, I am not. I know diet has been
15 purported to be connected with everything. I am
16 not really -- I have not read a lot about dietary
17 factors per se relating to lung cancer. I am sure
18 there have been some studies that looked at that,
19 but diet is a very broad -- it's very hard to link
20 diet unless you are specific to various cancers.
21 It's more related to G.I. cancers.

22 Q. Would it be correct to say that there is
23 literature out there, but you yourself have not
24 recently reviewed them or done --

25 A. I guess I would have to say that

1 higher risk.

2 Q. Would you agree that the number of
3 cigarettes that a person had smoked over their
4 lifetime, their pack per year history, is a risk
5 factor in lung cancer?

6 A. Yes.

7 Q. The more you smoke, the higher your risk
8 of cancer would be?

9 A. The amount of cigarette smoking and the
10 age that you started smoking is considered a risk
11 factor. Having said that, half of all patients
12 today that get cancer are former smokers. They are
13 smokers that have quit, which most people don't
14 understand. It's relatively interesting. It
15 certainly is true that -- I think that may play a
16 role in the age you start and then your exposure.

17 The problem is that if half of the
18 population that are going to get lung cancer are
19 former smokers, that means that the initial, if you
20 will, damage that somehow turns an oncogene on or
21 off and why do they wait so long to do it is still
22 relatively unknown.

23 I think that the age may play just as
24 important of a role as the amount of cigarette
25 smoking. I think a lot more work needs to go into

1 that. But you're correct. That is listed -- if
2 you ask a patient, the higher their pack per year
3 history is, then you can say, why does this person
4 who quit 14 years ago and only had a 20 pack year
5 history is in my office with lung cancer, and this
6 guy over here has smoked three packs per day from
7 age 5 to 90 and he doesn't have lung cancer.

8 It's really tough, but if you ask what
9 the common risk factors are, it's the age they
10 started smoking, the amount of cigarettes per day
11 that they smoked. Is a half a pack more damaging
12 than a pack? I don't think we know that. But the
13 span of time they smoked is probably important
14 because it increases their exposure over time to
15 whatever the factor is.

16 Q. I believe that you have noted in your
17 medical records that Mr. Little smoked one pack per
18 day for 20 years?

19 A. Correct.

20 Q. Do you have any knowledge as to whether
21 he smoked filtered or unfiltered?

22 A. No.

23 Q. Do you have any knowledge as to whether
24 he smoked a high tar or low tar brand?

25 A. No.

1 Q. Regular or menthol?

2 A. No.

3 Q. Do you have any knowledge as to whether
4 Mr. Little was exposed to Radon?

5 A. No.

6 Q. Did you ask him?

7 A. No.

8 Q. Do you have any knowledge as far as the
9 fat content of Mr. Little's diet?

10 A. No.

11 Q. Is that a question that you would have
12 asked him?

13 A. No.

14 Q. Whether Mr. Little had relatives with
15 cancer?

16 A. I didn't ask him that. Usually at some
17 point either the internist or the medical resident
18 probably asked him for a family history. I didn't.

19 Q. Was that information that you would have
20 reviewed?

21 A. It may be. We have to go back to the
22 exhibit that I think it was either Gladys Brooks.
23 PA, the physician assistant that worked him up.
24 There was a section in that original history and
25 physical that is usually listed as family history.

1 I don't remember whether she filled that in or not.
2 Unfortunately it's not one of the common things
3 that interns do.

4 Q. Do you have any knowledge as to whether
5 Mr. Little ever had pneumonia or any other
6 pulmonary infection?

7 A. I don't recall. I would have to go back
8 and look at the record.

9 Q. If the records that you authored don't
10 reflect any history of a pulmonary infection --

11 A. Unless he had some minor respiratory
12 tract infection that he went to his internist for,
13 I wouldn't have known that. It would have been
14 what got him to the doctor. A lot of people
15 present with lung cancer and they go through a
16 month of back and forth on antibiotics and that
17 could be part of the history. I don't recall if
18 that was his history. I recall that he was sent to
19 me with this abnormality on an X-ray, boom, here,
20 take care of it.

21 Q. Do you generally ask questions as far as
22 prior pulmonary infection?

23 A. Yes. I usually do, and it's related to
24 the fact that they are going to have surgery.
25 Their prior pulmonary history is important to what

1 their pulmonary function is going to be and their
2 ability to get through the operation. I am very
3 interested in whether they have asthma or CPLD or
4 constant respiratory tract infections, previous
5 pulmonary surgery, things like that.

6 Q. Do you generally ask a patient have you
7 had pneumonia?

8 A. Yes.

9 Q. Where would that information be reflected
10 in your medical records?

11 A. It should have been reflected -- and if
12 it was an important part of the history, and I
13 thought it was going to be important on the
14 surgical history, it would either have been in my
15 note or it would have been in the intern's or PA's
16 note.

17 Q. Dr. Reed, can you rule out that Mr.
18 Little's cancer may have been caused by
19 occupational exposures to carcinogens?

20 A. You can't rule it out because I don't
21 know what his exposure was.

22 Q. Could you rule out that his cancer was
23 caused by indoor Radon?

24 A. Only, I don't know if he had it in his
25 house.

1 Q. History of having marijuana use?

2 A. Again, I don't know any connection
3 between marijuana and lung cancer, so I can't speak
4 to that.

5 Q. And you don't have any knowledge as far
6 as what his marijuana use is, correct?

7 A. I did not ask him about that.

8 Q. Or cocaine use?

9 A. No.

10 Q. Could you rule out that his cancer was
11 caused by genetic predisposition?

12 A. No, I didn't look at his genes.

13 Q. Doctor, would you know Mr. Little's
14 relative risk of developing lung cancer from indoor
15 Radon? Would that be a sort of calculation that
16 you could do?

17 A. No. I can't remember -- I will be honest
18 with you -- in 15 years of asking anybody about
19 their Radon exposure, if that helps.

20 Q. But that is as far as you don't know
21 about his Radon exposure. If you did know about
22 his Radon exposure, would you be able to tell me
23 what his relative risk for developing lung cancer
24 would be?

25 A. I have no idea.

1 Q. Would this be true if you did know about
2 his occupational exposure? Would you be able to
3 then tell me what his relative risk of developing
4 lung cancer from those exposures was?

5 A. The only way to do that would be, let's
6 say he was a uranium miner. I think if you have
7 something like that you can go back to the
8 literature, because epidemiological studies have
9 been done. You could give a broad he is 40 times
10 higher than whatever. You are 40 times higher than
11 the general population that you are going to have
12 adenocarcinoma, something like that.

13 I think that would be very difficult to
14 do because you are not going to be able, since we
15 don't know what all the environmental -- you would
16 have to know the length of exposure and the time.
17 I think you are talking about a very nebulous
18 situation here. I wouldn't be able to take any of
19 the things that you said and say what is the
20 relative risk.

21 Q. That's not what thoracic surgeons do,
22 correct?

23 A. Right. It's very difficult information
24 to get ahold of because everybody has different
25 exposures. That is why the only studies that have

1 been done like that are very specific, uranium mine
2 workers, et cetera. You are talking about somebody
3 who is like you and me out in the world. So that
4 is a very difficult thing, unless -- again, even
5 asbestosis, which we know is related to
6 mesothelioma, if you worked all your life in
7 asbestosis, for me to even tell you what your
8 increased risk is compared to somebody who lives
9 and just happens to be in a house with asbestos I
10 think would be difficult.

11 Q. And that is the sort of thing that
12 epidemiologists with a supercomputer --

13 A. I am trying to say even then you are
14 going to get -- like you have already used the term
15 "increased risk." What does increased risk mean?
16 Is it four times, five times, six times? I
17 think -- all that study that they do,
18 epidemiologists' data, a lot of it is, in my
19 opinion, soft because, again, you are looking at
20 links and not let's give the rat the poison and you
21 get the data. That is a very different science
22 from a cause and effect, put two chemicals together
23 and get the result or take a gene and break it
24 down, et cetera. You are talking about
25 associations.

1 So you can say that if you study this
2 population and they happen to have more
3 association, you know, to make the statement that
4 this is a risk factor in my mind is a little soft
5 science.

6 Q. Would it be fair then you sitting here
7 today that it would be outside your area of
8 expertise to offer a number of what Mr. Little's
9 relative risk of developing lung cancer from
10 smoking from a 20 year, 20 year pack history of low
11 tar cigarettes?

12 A. Right. The only thing that I can testify
13 to this whole thing is; A, as I said before when
14 you asked me, I am not an epidemiologist, nor will
15 I testify that I am an expert in epidemiology. If
16 you ask me did this man have risk factors that
17 could lead to lung cancer, my answer is going to be
18 the same as I answered months ago. He is a smoker
19 and smokers are increased risks to get lung cancer.

20 So is that what caused his lung cancer?
21 Again, it's a risk. He has an associated factor
22 with known increased lung cancer. What is his
23 specific risk? I don't think anybody can tell you
24 that.

25 Q. Is it fair to say then in light of that

1 statement that you could not testify with a
2 reasonable degree of medical certainty that smoking
3 alone was the cause of Mr. Little's lung cancer?

4 A. Smoking alone?

5 Q. Yes. Or that smoking was indeed the
6 cause of Mr. Little's lung cancer.

7 A. What I would testify to is that
8 smoking is a risk factor of lung cancer. He was a
9 former smoker. He was therefore at increased risk
10 compared to the nonsmoker of getting lung cancer.
11 Was it the exact cause of his lung cancer? No, I
12 can't say that. I can't say that.

13 You know, unless I take a gun and shoot
14 you, I know that is what caused the hole. No, you
15 can't do that. Again, this is -- you are back
16 to -- I just -- if you ask me do I know that his
17 smoking caused his lung cancer, no. Is it an
18 increased risk that led to it? Yes, I think it is.

19 Q. Doctor, you have discussed a little bit
20 about the difference between epidemiology and
21 animal studies where you give the rat the substance
22 and the rat then develops a tumor.

23 A. Right.

24 Q. Are you aware of any medical studies or
25 published literature where they administered

1 cigarette smoke to a rat, inhaled and they
2 developed lung cancer?

3 A. Yes. Beagles. It occurred in dogs
4 actually. The study was done a long time ago.
5 There have also been some studies in San Diego by
6 Dr. John Benfield's group that looked at some of
7 the carcinogens in cigarettes and what they caused
8 in mice. I don't know if he used mice or rats. He
9 has a model. But there was actually -- it was a
10 long time ago -- a model. It was actually beagle
11 puppies.

12 Q. Your file, I believe, showed that you
13 received copies of the CVs for at least one of
14 defendants' expert witnesses. And you have
15 received those from plaintiff's counsel. Do you
16 know why Ness Motley sent you those?

17 A. Can you tell me what I received?

18 Q. I believe you received CV in expert
19 disclosure for Dr. Sanford Barsky.

20 A. Who is he? Can you tell me who he is so
21 that will ring a bell?

22 Q. He is one of the defendants' expert
23 witnesses in this case.

24 A. What does he do? That is what I am
25 asking. What is his specialty?

1 Q. He is a pathologist.

2 A. A pathologist?

3 Q. Yes. Do you recall having received any
4 expert disclosures?

5 A. Yes. That is why I am asking. I think
6 it was a pathology report. So it must have been
7 Dr. Barsky because that name is also ringing some
8 bell in the back of my head. That is why I was
9 asking what he does. I did receive an expert
10 testimony, a copy of somebody who had rendered an
11 opinion regarding pathology.

12 Q. Okay.

13 A. It's been a long time since I read it,
14 but I do remember getting it, yes.

15 Q. What were you asked to do with that
16 information? Were you asked just to review it?

17 A. As I remember, it was sent FYI. I was
18 not asked to review it in preparation for testimony
19 or anything like that.

20 Q. Other than the one that you believe was
21 on pathology, did you receive any other disclosures
22 or CVs for your review?

23 A. I don't remember that I did, but I do
24 remember the pathology one.

25 Q. Have you ever heard of Sanford Barsky of

1 UCLA?

2 A. No.

3 Q. Can we just take a quick break? I think
4 we are about done.

5 (A break was taken.)

6 MS. SCHMAHL: That is all that we have.

7 MR. EVANS: Any questions?

8 MS. HUGHES: No.

9 MR. EVANS: I have no questions at this
10 time.

11 MS. SCHMAHL: Doctor, thank you.

12 (Ending time: 9:30 a.m.)

1 CERTIFICATION OF REPORTER

2 I, Rochel Albert, Certified Court
3 Reporter and Notary Public in and for the State of
4 South Carolina do hereby certify that CAROLYN REED,
5 M.D. was duly sworn by me to testify to the truth,
6 and that the above deposition Pages 87 through 142,
7 inclusive, was recorded stenographically by me and
8 transcribed through computer-aided transcription by
9 me to the best of my ability.

10 I further certify that the foregoing
11 transcript is a true and correct transcript of the
12 testimony given by the said witness at the time and
13 place specified.

14 I further certify that I am neither
15 attorney or counsel for nor related to or employed
16 by any of the parties to the action in which this
17 deposition is taken, or financially interested in
18 this action

19 IN WITNESS WHEREOF, I have set my hand
20 and seal this 24th day of May, 2000.

21

24 CERTIFIED SHORTHAND REPORTER
25 NOTARY PUBLIC FOR SOUTH CAROLINA
MY COMMISSION EXPIRES: JULY 2008

1 CASE: LITTLE V. BROWN & WILLIAMSON, ET AL

2 WITNESS: CAROLYN REED, M.D. Vol III

3
4 SIGNATURE OF DEPONENT

5 I have read the entire deposition. To the
6 best of my knowledge it contains a true and accurate
7 transcript of the proceedings had at the time and
8 place herein mentioned. Any corrections that I have
9 are contained and described on the following
10 correction sheet.

11 Signed this the _____ day of _____,
12 2000.
